

SHAREPOINT® WARFIGHTER KIT

Manage Personnel Rotation	Protect Critical Data	Rearrange Site Taxonomy	Avoid Cross Domain Spillage	Reduce Operational Cost
---------------------------	-----------------------	-------------------------	-----------------------------	-------------------------

AvePoint, Inc. helps protect and manage SharePoint deployments within the Army, Navy, and Marine Corps as well as a number of Joint Commands. Its DocAve Software Platform is a comprehensive, scalable, and fully integrated solution that helps organizations reap the full benefits of their SharePoint environments.

As Microsoft SharePoint for the Department of Defense rapidly moves from a basic collaboration and portal tool to a mission-critical data platform for the Warfighter, the DoD is faced with a series of challenges, and AvePoint has the solution:

- ★ **Centralize** SharePoint farm (multi-farm) administration and significantly reduce time devoted to mission-critical administrative tasks such as managing securities and permissions for heavily rotating military personnel
- ★ **Report** on user and group activity, access, and data usage as well as action reports on the life of a document or site
- ★ **Minimize** operational impact when a file or site is lost – and the CO wants it now – with a granular level of recovery that is fast and efficient for mission-critical data along with COOP capabilities
- ★ **Simplify** the creation, moving or rearranging of SharePoint site structure taxonomy and its content to shifting command desires
- ★ **Prevent** spillage by providing COs with the proper tools needed to assess, control, and mitigate damage when cross domain spillage occurs, while in turn preventing future occurrences
- ★ **Increase** efficiencies across the DoD by leveraging optimal storage solutions to reduce cost and bandwidth challenges

To specifically address some of the critical DoD challenges with SharePoint, AvePoint is providing the Armed Forces and Joint Commands with the SharePoint Warfighter Kit. Addressing the specific needs of the DoD and its SharePoint environments, these solutions enhance control, increase productivity, and enhance security while reducing total cost of ownership. For Program Management shops fielding SharePoint, you can instantly add these capabilities to your program offering.

SHAREPOINT[®] WARFIGHTER KIT

5 packaged solutions discounted at more than 2x standard government discount

Manage Personnel Rotation	Protect Critical Data	Rearrange Site Taxonomy	Avoid Cross Domain Spillage	Reduce Operational Cost
<ul style="list-style-type: none"> Centralize administrative control enabling audit user access and activity reports as well as deploy administrative changes across the entire SharePoint farm or deployment. With constant personnel turnover and change in roles and responsibilities, easily manage users and synch with Active Directory. Manage chargeback programs when a parent or subordinate command is hosting an environment for multiple commands. 	<ul style="list-style-type: none"> Recover data 5x faster than its native counterparts. Perform platform-level back up with an item-level recovery on multiple data assets at one time, while retaining the full fidelity of metadata and securities on mission-critical assets. Recover your entire SharePoint platform with a simple DNS switch to ensure proper failover for Continuity of Operations (COOP). Recover mission-critical SharePoint Sites with 0 data loss. 	<ul style="list-style-type: none"> A simple point-and-click interface saves time and resources, while eliminating the headaches of rearranging site structure taxonomy or moving content, securities, and configurations across farms. Easily promote or demote sites and site collections as well as move content, securities, and configurations from staging environments to production quickly as operational and mission objectives evolve and change. 	<ul style="list-style-type: none"> Ensure proactive security compliance by scanning content within SharePoint (e.g. while uploading sensitive PII data). Should the data violate the criteria defined by an administrator, it will either flag the content for review or quarantine the document while notifying the end-user and administrator of the violation. Save hours or even days of downtime scrubbing typically incurred when there is an assets spillover across secured domains. 	<ul style="list-style-type: none"> Increase SharePoint performance while saving more than 30 percent on storage costs. Route information from SQL Server content databases to a more cost-effective storage medium, reducing storage costs while maintaining seamless access to the content, invisible to the warfighter. Ensure optimum SQL Server performance by defining and setting a policy for real-time archiving based on a Binary Large Object's (BLOB) file size.
