

Replicator

Migrate. **Integrate. Manage.** Optimize. Protect. Report.

Integrate. Manage. Ensure optimal Microsoft® SharePoint® 2010 performance and content availability by replicating content, configurations, and security within or across globally distributed farms.

Key Benefits

- Synchronize critical SharePoint content across local or globally distributed environments via a centralized, highly intuitive management console
- Automate content publication within or across SharePoint farms to streamline content lifecycle management
- Ensure optimal performance and content availability to deliver seamless global collaboration by replicating content, configurations, and security to geographically distributed farms
- Enhance SharePoint service quality and resiliency against service failure with customizable controls for unreliable network connections, ensuring global content remains synchronized

Replicate from one SharePoint location to another, within the same farm or across global environments.

Synchronize SharePoint Content across Distributed Environments

As SharePoint environments expand to support more complex content management or global collaboration initiatives, organizations must find robust solutions to support a seamless SharePoint service. DocAve Replicator for SharePoint 2010 enables administrators to replicate SharePoint content, configurations, and security within a single SharePoint environment, or across multiple SharePoint farms. With configurable one-way, two-way, or one-to-many online or offline replication options, organizations can provide global SharePoint users with optimal content availability.

Technical Overview

- Replicate an entire site collection or individual items, and even automate content selection based on customizable business rules or event-based triggers
- Through a centralized management console, synchronize content within a single SharePoint environment or across multiple geo-distributed farms, even over extranets without opening extra ports in your firewall
- Keep SharePoint content synchronized across farms. Data added or altered in one location will automatically update in alternate locations, leveraging customizable rules to resolve any conflicts
- Perform live, real-time replication based on customizable event triggers (including item update, deletion, and check-in) or perform scheduled replications as often as every 15 minutes
- Leverage byte-level differencing, change-log technology to only transfer updated content, throttling controls with connection re-try's, compression, or offline replication options to bandwidth consumption and optimize network resources
- Automated container creation, deletion synchronizations, and the ability to rename content as you go provide for comprehensive management to globally distributed content
- Protect SharePoint content in the event of an accidental overwrite to content, configuration, or security – similar to an undo function, roll back altered content to its original state
- Configure up to five concurrent threads to optimize efficiency with parallel replication of content across geographically dispersed locations

Synchronize critical SharePoint content within or across environments with DocAve's centralized, highly intuitive management console.

As with all DocAve products, DocAve Replicator leverages only fully supported Microsoft methodologies and APIs.
