AvePoint® Release Notes

AvePoint RevIM 3.0.0

Release Notes

Issued April 2016

New Features and Improvements

- Now supports Windows 10.
- Various minor bug fixes and general back end improvements.

Known Issues

- When the term selected in a Term Usage Report profile has been deleted from AvePoint RevIM, but the term is still being used by documents in SharePoint, select this profile and show report. The information on the documents that use the term is not collected in the report.
- Associate a term with a rule where the **Enable manual approval** option is selected. Use the term for a document in SharePoint. In the **Disposal Activity Management** interface, select the SharePoint node where the document exists and click **Run Now**. Create a content due for disposal report profile, select the SharePoint node where the document resides as the reporting scope, and then generate a report. The document is collected in the report.
  Root cause: When the **Enable manual approval** option is selected in a rule, the status of the document that meets the rule settings will be marked as **Waiting for Approval** and stored in the Archiver database. When generating a content due for disposal report, the Client API will scan the SharePoint node and generate the report. The **Waiting for Approval** status of documents in the Archiver database cannot be retrieved by the Client API. Thus, the document is still reported.
- Associate a term with a rule where the **Archive and remain content in SharePoint** option is selected. Use the term for a document in SharePoint. In the **Disposal Activity Management** interface, select the SharePoint node where the document exists and click **Run Now**. Create a content due for disposal report profile, select the SharePoint node where the document resides as the reporting scope, and then generate a report. The document is collected in the report.
  Root cause: When the **Archive and remain content in SharePoint** option is selected in a rule, the status of the document that meets the rule settings will be stored in the Archiver database. When generating a content due for disposal report, the Client API will scan the SharePoint node and generate the report. The status of documents in the Archiver database cannot be retrieved by the Client API. Thus, the document is still reported.
- Configure SharePoint settings for a SharePoint sites group/site collection/site where a library exists. After the SharePoint settings job finishes, create a new content type in the library. Run a SharePoint settings job again. The Managed Metadata type column created by AvePoint RevIM is not used by the new content type.
- Install AvePoint RevIM on a server where SharePoint 2013 Central Administration or Web front-end server is not installed. Log into AvePoint RevIM and generate a content due for disposal report or a term usage report. The generating report job finishes with an exception. No information is collected in the report.
  Root cause: AvePoint RevIM uses **Microsoft.SharePoint.Client.dll** to collect information for the content due for disposal report and term usage report. In a server where SharePoint 2013 Central Administration or Web front-end server is not installed, the version of **Microsoft.SharePoint.Client.dll** used by AvePoint RevIM and the one that can be used to collect report information are different. Thus, no information can be collected in the report.
- Register a site collection with user 1 in **DocAve** > **Control Panel**. Create a rule in the **Rule Management** interface. Create an AvePoint RevIM term and associate the term with the rule in

the **Term Management** interface. Use the term for a document in SharePoint. Check out the document within the site collection using another user. In the **Disposal Activity Management** interface, select the SharePoint node where the document exists and click **Run Now**. The checked out document that meets the associated rule is not scanned by DocAve Archiver job. Root cause: This issue is caused by the limitation of Client API.

- Create a rule with the **Archive and remain content in SharePoint** option selected and configure other rule settings. Associated a term with the rule. Use the term for a document in SharePoint and then check out the document. In the **Disposal Activity Management** interface, select the SharePoint node where the checked out document exists and click **Run Now**. The checked out document that meets the associated rule is not executed the actions configured in the rule. Root cause: This issue is caused by the limitation of Client API.
