

**AvePoint®**  
**DocAve® Online**  
 Using DocAve Online for Deployment Management

## Event

Ernie, your IT administrator, is responsible for rolling out your SharePoint designer's customizations.

This includes features, site definitions, and custom Cascading Style Sheets (CSS) across your intranet and public-facing sites hosted on SharePoint Online production environments.

Ernie follows this quick and easy process using DocAve Online:

### Step 1

Instead of manually reviewing each site, he compares multiple sites at once. Any customization issues are shown through an intuitive graphical user interface.

### Step 2

He can apply customizations to one, multiple, or all sites.

### Step 3

Ernie confidently deploys customizations knowing sites can be rolled back to the previous state.

### Step 4

Auditable records of every update are maintained.

The new intranet and public-facing sites can be announced with assurance that all rebranded elements function properly.

## End Result

#### For Designers

Free to concentrate on design instead of being bogged down by rollout and testing concerns.

#### For IT Administrators

Ensure consistency across all pre-production and production instances, and the integrity of the production environment is never compromised.

#### For Organizations

Realize lower operational costs and improve IT efficiency through automation.
