

DOCAVE REPLICATOR

FOR MICROSOFT® SHAREPOINT® REPLICATION

Manage. Ensure optimal Microsoft SharePoint performance and content availability with real-time publication and synchronization.

KEY BENEFITS

 <p>ENTERPRISE-WIDE SYNCHRONIZATION</p>	 <p>PRODUCTIVITY IMPROVEMENT</p>	 <p>CONTENT AVAILABILITY</p>	 <p>SERVICE ENHANCEMENT</p>
<p>Synchronize business-critical SharePoint content across local or globally distributed environments - including SharePoint Server and Office 365 - SharePoint Online environments.</p>	<p>Improve end-user productivity and provide fast access to the latest content, configurations, workflow history, versions, and security with multiple, real-time synchronization options.</p>	<p>Ensure content availability across geographically distributed teams by automating content publication within or across SharePoint farms and/or extranets.</p>	<p>Enhance SharePoint service quality and resiliency against WAN/service failure to ensure global farms remain synchronized regardless of available network resources.</p>

SYNCHRONIZE SHAREPOINT CONTENT ACROSS DISTRIBUTED ENVIRONMENTS

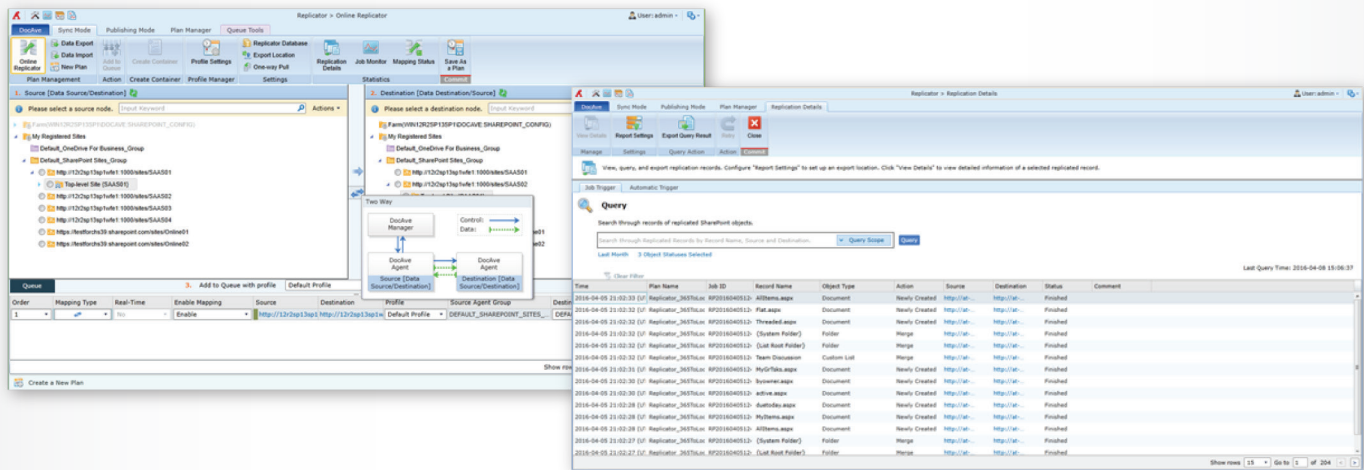

As SharePoint environments expand to support more complex global collaboration initiatives, organizations must find solutions to support a seamless SharePoint service. DocAve Replicator for SharePoint enables administrators to replicate SharePoint content, configurations, and security within a single SharePoint environment or across multiple SharePoint environments – whether hosted on on SharePoint Server or Office 365. With event-driven and configurable one-way, two-way, or one-to-many online or offline replication options, organizations can provide global SharePoint users with optimal content availability.

TECHNICAL OVERVIEW

- Replicate content within a single SharePoint environment or across multiple geo-distributed SharePoint environments to seamlessly manage multiple on-premises, online, and hybrid SharePoint environments via a centralized management console
- Trigger specific actions including copy, delete, update metadata, send e-mail alert, or update approval status to all or specific destination lists or folders based on configurable publishing rules
- Synchronize an entire site collection or individual items, automating content selection based on properties or business rules to streamline content synchronization within or across environments – including extranet sites hosted in Office 365
- Utilize one- or two-way replication with customizable rules to resolve any conflicts in order to keep SharePoint content synchronized across farms
- Perform live, real-time replication based on customizable event triggers (including item update, deletion, and check-in) or perform scheduled replications as often as every 15 minutes
- Utilize byte-level differencing, change-log technology to only transfer updated content, throttling controls with connection re-try, data/differential data compression, or offline replication options to optimize bandwidth consumption and available network resources
- Monitor and view performance, quality, and best practice suggestions for your real-time and scheduled replication operations with Health Analyzer
- Delegate replication plan management to site collection owners or individual content owners directly, allowing them to update properties before the content is replicated to the destination
- Automated site collection, site, list/library, and folder creation as well as deletion synchronizations and on-demand content renaming provides comprehensive management for globally distributed content
- Protect SharePoint content in the event of an accidental overwrite to content, configuration, or security settings – similar to an undo function, roll back altered content to its original state

Synchronize critical content within or across SharePoint Server 2010, 2013, 2016, or Office 365– SharePoint Online environments.
